

BUCKLE AND VELCRO® RESTRAINING STRAPS

Features:

The restraining straps with buckle and Velcro® are conceived under the same principle as the Clipbelt® straps and their main application is to achieve a certain degree of immobilisation of the user when in bed, chair, wheelchair or armchair, allowing the patient to become free without the help of an attendant.

They are easy to use, set up and adjust making them really useful for emergency services, intensive care, traumatology, orthopaedics, ambulances, geriatrics, etc. The restraining straps are made with polypropylene band and come with soft cotton padding to prevent injuries and add comfort for the user.
